

Jalmenus evagoras evagoras collected on the Bunya Mountains tend towards an intermediate form between *evagoras* and *eubulus* Miskin.

Pseudodipsas cuprea flew on a dry ironbark-grasstree hilltop at 6-12 m among ironbark leaves. Males lack copper colouring but have some blue scales on their upper wing surfaces. This species has previously been recorded only as far north as Toowoomba (Common and Waterhouse, 1972).

Pseudodipsas myrmecophila. Three males were captured and two others missed, flying around a small low bush. There was an extreme fire warning at the time with a harsh dry wind blowing and a humidity of about 5%. These records establish a new locality for this rare species.

Paralucia pyrodiscus pyrodiscus and *Paralucia aurifera* flew together at a rain forest edge on the Bunya Mountains.

Philiris innotata innotata. I have collected only two females of this species during a very wet period during February, 1971.

In addition to those species listed a single female lycaenid, possibly a new species, has been taken. A fast flying azure seen may well prove to be *Ogyris ianthis* Waterh. and *Trapezites maheta maheta* (Hew.) has been collected within 30 kilometres and may well occur in the area.

Acknowledgements

I wish to thank Dr I. F. B. Common and Mr E. D. Edwards for examining specimens of *Pseudodipsas cuprea*, and Miss J. A. Walden for typing the manuscript.
